# Bio-vegan Farming

Bio-vegan farming cultivates vegan food organically and “veganly”, that is it completely renounces animal husbandry and animal and synthetic inputs in the production chain.

- meets growing demand for vegan food produced at vegan standards
- strengthening of regional economic cycles: humus formation from local plant residues possible
- no animal cruelty
- no germs, antibiotics and heavy metals contamination from fertilizers of animal origin
- relief for environment, wildlife and public health: avoiding devastating effects of animal husbandry like damage to soil, groundwater and oceans, high greenhouse gas emission, increased land requirements, antibiotic resistances and risk of zoonotic diseases
