Silvopastoral Agroforestry Systems

In silvopastoral agroforestry systems, woody plants are combined with grazing land and livestock farming, thus fusing livestock farming with the production of (energy) wood or with the production of food or feed.

sustainability
potential

- higher biodiversity
- reduction of soil erosion
- buffering of weather extremes: shading and protection against erosion by wind and water
- higher productivity in animal feed, meat, egg and milk production
- less suffering: similarity to natural habitat of animals
